                                                                                                                          ő
                                                                                                                                                                                                                   CC (AMP) activated kinase (AMPX) gamma subunit muscle-specific isoform, CC complete PRRAG3. Prkag3 gene is located in the RN locus of chromosome CC 15. Mutation in Prkag3 results in an altered regulation of carbohydrate metabolism, particularly in skeletal muscle. PRRAG3 is useful as CC therapeutic for treating carbohydrate metabolism disorders such as CC diabetes, obesity, and disorders associated with muscle metabolism CC such as myopathy and cardiovascular diseases, to modulate AMPX CC activity, and for restoring a normal AMPX function. PRRAG3 sequence CC and its functionally altered mutants are useful for the diagnostic cevaluation, genetic testing and prognosis of a metabolic disorder, CC preferably a carbohydrate metabolism disorder. Primers that can detect ca genetic polymorphic marker linked to a sequence encoding PRKAG3, are useful for detecting a dysfunction of carbohydrate metabolism resulting CC from the expression of a functionally altered allele of PRKAG3. CC heterotrimeric AMPX consisting of PRKAG3 or its mutant, are useful for screening compounds able to modulate AMPX activity. Nucleic acid cencoding PRKAG3 is useful for detecting mutations in a Prkag3 gene, or in a sequence encoding the first cystathione beta synthase (CBS) domain cc of PRKAG3 and is useful in gene therapy.
                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1471
                                                                                                                                                                                                                                                              ű
```

CC (AMP) -activated kinase (AMPK) gamma subunit muscle-specific isoform, CC PRKAG3. Prkag3 gene is located in the RN locus of chromosome 15.

CC Mutation in Prkag3 results in an altered regulation of carbohydrate CC metabolism, particularly in skeletal muscle. PRKAG3 is useful as CC therapeutic for treating carbohydrate metabolism disorders such as CC diabetes, obbsity, and disorders associated with muscle metabolism CC such as myopathy and cardiovascular diseases, to modulate AMPK CC activity, and for restoring a normal AMPK function. PRKAG3 sequence CC and its functionally altered mutants are useful for the diagnostic CC valuation, genetic testing and prognosis of a metabolic disorder. CC preferably a carbohydrate metabolism disorder. Primers that can detect a genetic polymorphic marker linked to a sequence encoding PRKAG3, are CC useful for detecting a dysfunction of carbohydrate metabolism resulting from the expression of a functionally altered allele of PRKAG3. CC Transgenic animal and host cell transformed with PRKAG3 or a carbohydrate animal and host cell transformed with PRKAG3 or a carbohydrate animal and host cell transformed with PRKAG3 or a carbohydrate animal and host cell transformed with PRKAG3 or a carbohydrate animal and host cell transformed with PRKAG3 or a carbohydrate animal and sequence encoding PRKAG3 is useful for detecting mutations in a Prkag3 gene, or in a sequence encoding the first cystathione beta synthase (CBS) domain CC of PRKAG3 and is useful in gene therapy.

Claim 1; Page 429; 1963pp; English

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and CS sequences ABA08235-ABA09574 represent nucleic acids encoding them. The CS invention also relates to vectors and recombinant host cells comprising a CC nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides or polypeptides in a sample, and methods of identifying compounds which CC bind to polypeptides of the invention. Although novel, many of the CC polypeptides of the invention have homology to known proteins, thereby CC giving an insight into their probable biological activities, and hence CC potential therapeutic applications. The polypeptides of the invention may that we various activities; stem cell growth factor activity; climmunomodulatory activity; stem cell growth activity; immunomodulatory activity; stem cell growth activities; chemotactic or chemokinetic activities; haemostatic, thrombotic or thrombotic or chemokinetic activities; haemostatic, thrombotic or thrombotic or chemokinetic activities; haemostatic, thrombotic or conditions, e.g., by protein or gene therapy. Such conditions include cancer cell proliferation or metastasis.

CC disorders), chronic inflammatory conditions (e.g., asthma or arthritis), protein or gene therapy. Such conditions include cancer cell proliferation or arthritis), bene disorders (e.g., myeloid or lymphoid cell carcerial ischaemia, bone disorders (e.g., myeloid or lymphoid cell carcerial ischaemia, bone disorders (e.g., osteoporosis), and abnormal cepair (or nucleic acids encoding them) may be used to promote wound bacterial and fungal infections in addition to immune disorders to conterides with growth factor activity may be used in cell cultures to Polypeptides with growth factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a cDNA encoding a novel human polypeptide of the invention.

The human pancreatic cancer antigens have cytostatic, CC neuroprotective, nootropic, immunomodulatory, relaxant, contraceptive, CC neuroprotective, nootropic, immunomodulatory, relaxant, contraceptive, CC in gene therapy. The polynucleotide and proteins can be used for CC preventing, treating, or ameliorating a medical condition or in assays CC for diagnosing a pathological condition or a susceptibility to one in a CC subject. Binding partners to the proteins and the activity of the CC proteins can be identified. The pancreatic cancer antigens can be used to detect, treat or prevent pancreatic disorders, especially cancer. CC Agonists and antagonists to the antigens can be screened for. The CC pancreatic cancer antigen polynucleotides can be used to design nucleic acid hybridisation probes that can be used in chromosome mapping, linkage CC and diagnostic methods. The proteins can be used to generate antibodies which are used to purify, detect and target the polypeptides, including CC both in vivo and in vitro diagnostic and therapeutic methods. The considers can be used to generate antibodies can be used to design nucleic and diagnostic methods. The proteins can be used to generate antibodies CC entolis can be used to treat or prevent neural, immune system, muscular, repal or reproductive, gastrointestinal, pulmonary, cardiovascular, renal or considerative disorders. AAC99232 to AAC9920 and AAB54467 represent

                                                                                                                                                                                                                                                                                                                                                                                                                                                     This polynuclectide sequence encodes a mammalian 5'-AMP-activated protein kinase (AMPK) non-catalytic gamma subunit. AMPK polypeptides cabe used to identify compounds which regulate the action of kinases. Suc fragments can be used to reduce biosynthesis of cholesterol and fatty acids. They may also be used to inhibit the release of these molecules from intracellular stores by hormone sensitive lipase (HSL). They may also be used to reduce cellular malonyl CoA levels and promote the beta-oxidation of fatty acids by mitochondria. AMPK-alphal fragments could be used in the treatment of e.g. hypercholesterolaemia, hyperlipidaemia, obesity, clinical syndromes associated with hypoxia or ischaemia (e.g. myocardial infarction) disorders of nutrition and diabetes mellitus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated 5'-AMP-activated protein kinase subunit(s) - us develop products for treating e.g. hyper-cholesterolaemia, o hypoxia, ischaemia, nutrition disorders or diabetes mellitus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC kinase DAPK-7 (see AAW88438). DAPK-7 CDNA was first identified in C the PENITUTO1 cDNA library using a computer search for amino acid calignments, and a consensus sequence was derived from the extended cand overlapping incyte clones 3075712/HEARNOT01, 842220/PROSTUTO5, 1364747/SCORNONO2, 145972 and 145802/PENITUTO1 and 1479332/CORPNOT02. DAPK-7 shows 73% homology with the human foetal liver AMPK gamma cubunit (GI 1335856), and is associated with cDNA libraries which care immortalised or cancerous and show inflammatory or immune responses. The invention provides disease associated protein kinases CAPK-1 to DAPK-7 (see AAW88432-38) and cDNA clones encoding them (see AAX06831-36 and AAX06882), as well as expression vectors, host cells, agonists, antagonists and antibodies. The invention and treatment of diseases associated with cell proliferation, especially cancer or an immune response (claimed). Conditions that may be treated include arteriosclerosis, bronchitis, emphysema, hypereosinophilia, mycardial or pericardial inflammation, rheumatoid arthritis,

to the complementary strand of a polynucleotide which comprises one of CC the 5602 nucleotide sequences defined in the specification, where the CC ollgonucleotide comprises at least 15 nucleotides; or (b) a combination CC of an oligonucleotide comprising a sequence complementary to the CC complementary strand of a polynucleotide which comprises a 5'-end cC sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence complementary to a CC polynucleotide which comprises a 1 least 15 nucleotides and the combination of the 5'-end sequence, '-end sequence, where the CC the 5'-end sequence, '-end sequence, where the CC the 5'-end sequence, '-end sequence, where the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, CC the specification and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs and Sequences; AAH3632 to AAH3632 to AAH3632 to AAH3632 and CAAH3633 to AAH3742 represent human cold sequences; AAB9246 to AAH3633 control of the present oligonucleotides, all of which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                             The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from prosophila. The invent useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176 ABLIG171), expressed DNA sequences (ABLIG175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1115
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1467

RESULT
AAH43684
                The sequences given in AAH43681-84 represents genomic fragments encoding the human AMP-activated protein kinase gamma 3 subunit (PRKAG3). Detecting the presence of the PRKAG3 DNA, or a variant, is useful in determining a risk estimate of a metabolic disease, such as diabetes or obesity, in a subject. The variation may occur in exons 3, 4 or 10. In exon 3 variation may be a substitution of a G for a C at nucleotide 320, resulting in the amino acid substitution P71A; in exon 4 variation may be a substitution of a T for a C at nucleotide 550; and in exon 10 variation may be a substitution of a substitution of a T for a C at nucleotide 550; and in exon 10 variation may be a substitution of a Substitution of a T for a C at nucleotide 1037, resulting in the amino acid substitution R340W. There may also be nucleotide variatin in intron 6.
                                                                                                                                                                                     New variants of human AMP-activated protein kinase gamma3 subunit associated with a metabolic disease e.g. diabetes or obesity and edetermining a risk estimate of diseases in subject by detecti

ARS4951 to AAK64702 encode the human immune/haematopoietic antigen (1) CC amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic c activity, and can be used in gene therapy and vaccine production. (I) CC proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For CC example, they may be used to treat disorders associated with decreased cytostated with eactivity of (I) by expressions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to CC supplement the patients own production of (I). Additionally, (I) CC polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the CC protein. (I) proteins and polynucleotides may be used to prevent, CC diagnose and treat immune/haematopoietic-related diseases, especially concers and cancer metastases of haematopoietic antigen genomic conservation the present invention. AAK54942 to AAK54950 and AAM82169 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            17-NOV-2000
